EXPERIMENT 11

Execute and display the results for the following Nmap Timing and Performance commands in Kali Linux Operating Systems:

(i) Aggressive speed scan

(ii) Insane speed scan

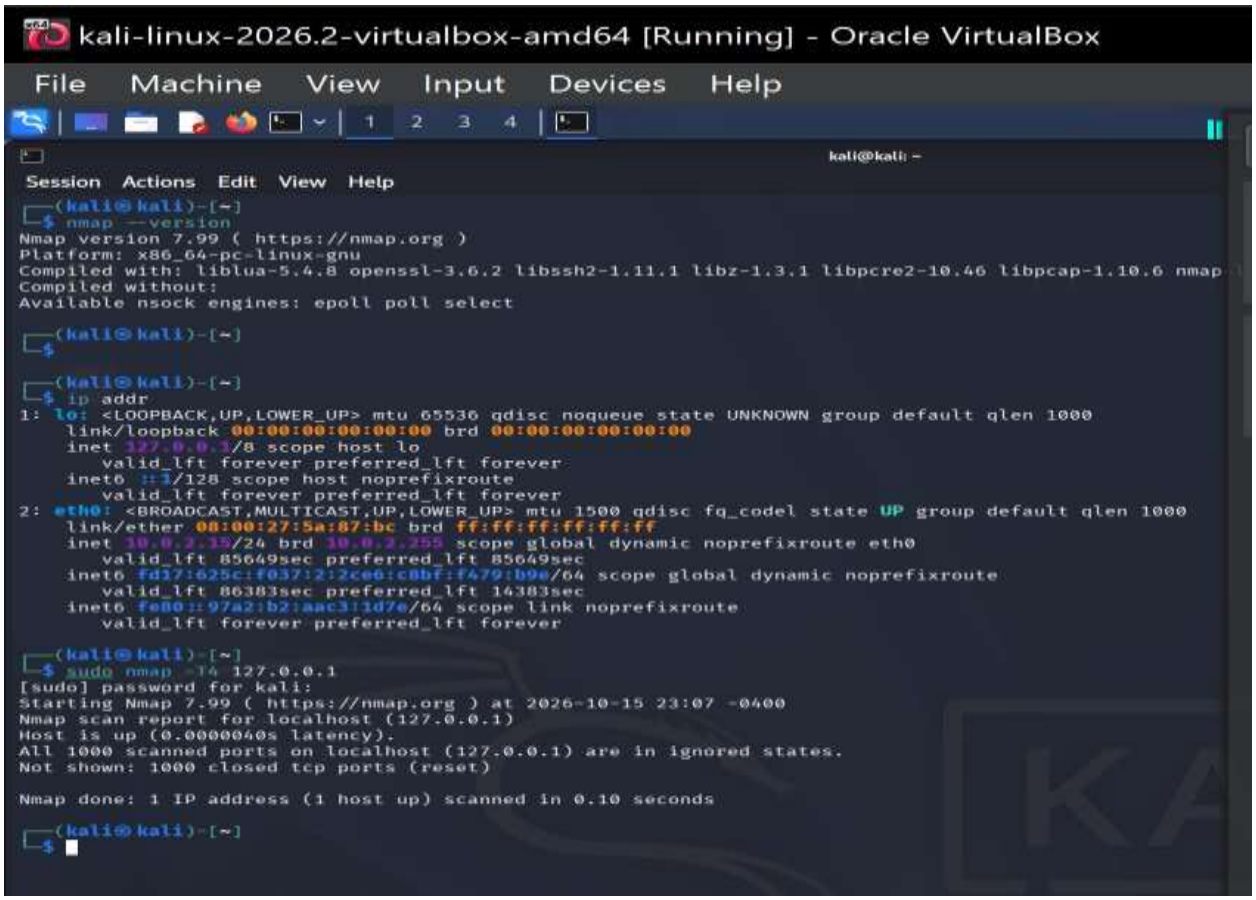

AIM : To execute and study the Nmap aggressive and insane timing commands in Kali Linux and observe their results.

DESCRIPTION:

1. Aggressive Speed Scan (-T4): The -T4 option uses Nmap's aggressive timing template to scan a target faster. It can be used when the target and network can handle faster scanning.

Command:

sudo nmap -T4 127.0.0.1

2. Insane Speed Scan (-T5): The -T5 option uses Nmap's most aggressive timing template. It aims for very fast scanning, but it may be less reliable on slow or congested networks.

Command:

sudo nmap -T5 127.0.0.1

RESULT : The Nmap timing and performance commands were successfully executed in Kali Linux. The -T4 option was used for aggressive timing, and the -T5 option was used for insane timing. Both scans reported the host as up and 1,000 closed TCP ports.
